

Claim Amendment under 37 C.F.R. §1.121

1. (Currently amended) A dispenser with a sealed dispensing valve unit, which is secured to a mouth of a hermetic casing holding a cream-type cosmetic that is deteriorated by contact with air and has high viscosity, and discharges contents through a center of an upper plate of a button, when the button having a shape of a concave dish is pushed to operate pumping means provided under the button, the dispenser comprising:

an outlet hole bored in a concave central portion of the button, with an inclined inner surface defining a lower portion of the outlet hole and being tapered in a direction from an upper portion to a lower portion of the inclined inner surface, and a vertical inner surface extending from an upper end of the inclined inner surface to a predetermined height; and

a dispensing valve having at a lower portion thereof a funnel-shaped inclined outer surface to selectively come into contact with the inclined inner surface of the outlet hole due to operation of the pumping means, thus opening or closing the outlet hole, with a vertical outer surface extending upwards from an upper end of the inclined outer surface to a predetermined height,

wherein an outer diameter (d) and a height (t) of the vertical outer surface of the dispensing valve are smaller than an inner diameter (D) and a height (T) of the vertical inner surface of the outlet hole, so that some of the contents are filled between the vertical outer surface and the vertical inner surface, thus providing a sealing film over the dispensing valve and the concave central portion of the button against air,

wherein the contents are discharged from the lower portion, which is connected to the hermetic casing, to the upper portion of the inclined inner surface of the outlet hole.

2. (Previously canceled)
